Access PoD v1.0

Reader and Reviewer Guide

Release orientation, learning and research prompts
Guide v0.1

Document Control Information

Document Identifier: APOD-GUIDE-001
Title: Access PoD v1.0: Reader and Reviewer Guide
Guide Version: v0.1
Date: 11 October 2026
Guide Status: Draft for Review · Informative
Supporting Release: Access PoD v1.0 · v1.0-consolidated
Release Designation: Public Review Draft · Consolidated Edition 1
Author: Anthony Siljeg
Affiliation: Alnotrea Labs / Policy of Developments - Access PoD Initiative

Distribution Statement

This guide accompanies the **Access PoD v1.0 consolidated Public Review Draft**. It provides an introduction to the collection, explains the relationships between its research papers and supporting materials, and offers questions and prompts for structured exploration.

It is intended for researchers, reviewers, educators, developers and governance practitioners.

Intended uses include:

- orientation to the Volume 2 papers, governance artifacts and Access-Mode materials;
- learning about reasoning postures, responsibility, scope, evidence and human review;
- academic research, comparative analysis and discussion;
- setting up a scoped learning project using the relevant guidance and module set; and
- preparing feedback on clarity, interpretation and example use.

The guide is informative. The individual papers, release notes and current component guidance provide the detailed scope and usage instructions for each part of the collection.

AI-assisted responses should be reviewed against the referenced materials, with source statements, assumptions and interpretations kept distinguishable. The guide does not establish certification, regulatory compliance or deployment readiness.

Feedback is invited to support refinement of this guide and future editions of the collection.

5. Record and share your findings 5
6. Essential links 5

1. About this release

Access PoD v1.0 brings together selected Volume 2 governance papers and supporting artifacts, alongside Access-Mode guidance, modules and worked examples.

The collection provides an organisational research reference for exploring the governance of AI systems. Its materials connect responsibility, evidence structures, lifecycle boundaries and human review with structured AI-assisted reasoning.

This consolidated edition provides shared navigation while retaining the original identities and versions of its components. It is published as a **Public Review Draft**, with feedback invited on clarity, interpretation and use in research.

The main repository README is the starting point. It includes a collection map, links between the materials and suggested reading routes.

2. How the materials fit together

Material	Role in the collection
Versions A–D	Governance research and supporting artifacts covering foundations, illustrative architecture, onboarding and lineage, and governance stress scenarios.
Version E	The Access-Mode method and the separation of reasoning postures.
Companion E.2	Informative context on artifact states and lifecycle.
ID1 · Learning	Exploring concepts, responsibility, intent, scope, assumptions and reflection.
ID2 · Operational/runtime reasoning	Examining scenarios, interpreting signals and recording comparisons within a defined scope.
ID3 · Inspection	Inspecting selected records and studying the documented packaging workflow and session-completeness rule.

ID1, ID2 and ID3 serve different tasks. They are not a mandatory sequence or maturity scale.

ID2 includes both **two-candidate and four-candidate examples**. The two-candidate example supplies a session record and six module JSON records per case; the four-candidate example supplies a session record and one Module 03 JSON record per case. The supplied ID3 workflow retains its original two-candidate context. The ID2 index explains the available records and reading routes.

3. Choose how to begin

Read and discuss

Choose a paper, module or example relevant to your question. Read its current guidance and notes alongside the source material.

You can study the collection without running scripts or configuring an AI project. A useful first task is to identify the document's purpose, assumptions, supporting evidence and open questions.

Set up an AI-assisted learning project

For an initial learning project, ID1 provides a suitable starting point.

Use the Access-Mode collection guide to select the matching:

- Mode README.
- Control file.
- All six numbered priming modules.

For standalone ID1, these are README_ID_1.md, modules/Learning_mode.md and the six numbered files in modules/, under v1.0-access-mode/ID_1-core/.

Create a separate working project and complete the priming modules using your own inputs. Keep the worked exemplars in a **separate reference project**. The examples illustrate a learning approach; their answers and checked selections do not represent your own decisions.

The current ID1 notes explain the distinction between the earlier embedded examples, standalone primers and worked exemplars.

Explore a documented local workflow

Readers interested in the ID2 comparison tools or ID3 inspection and packaging workflow should follow the relevant component guide, using a separate working copy.

Asking an AI assistant to explain a workflow is a reading exercise. Performing that workflow requires its documented setup, inputs and review steps.

4. Questions and prompts to try

The following prompts support orientation, learning and documentary review. Provide the relevant files or links, and check that your AI assistant can actually read them.

A useful opening instruction is:

Use the Access PoD materials I provide for claims about this collection. Identify the files and versions you can read, cite the relevant sections, and distinguish source statements from your interpretation. State when information or evidence is missing.

Prompt 1: Understand the release

Using the README and release notes, explain what Access PoD v1.0 brings together. Map the roles of Versions A–D, Version E, companion E.2 and the three Access-Mode postures. Recommend a starting point for someone interested in **[my topic]**.

Prompt 2: Read a paper as a researcher

Help me study **[paper title and version]**. Identify its research questions, key concepts, proposed mechanisms, supporting examples and stated limitations. Distinguish proposals from demonstrated results, and suggest three questions for further investigation.

Prompt 3: Define a learning project

Using ID1, help me define a learning project about **[topic or hypothetical AI workflow]**. Clarify its purpose, audience, scope, assumptions and how AI may assist. Ask me about missing information, then help me write a short learning brief.

Prompt 4: Build a source map

Using **[selected documents]**, create a table of their titles, versions, relevant statements and intended use in this study. Identify agreements, differences and missing evidence. Keep source statements separate from our interpretation and flag unresolved authority questions.

Prompt 5: Apply the Access PoD lens

For **[a hypothetical workflow]**, help me map responsibilities, decision points, data use, handoffs and opportunities for human review. Distinguish proposed controls from any observations supplied. What evidence would help a researcher examine the claims?

Prompt 6: Study the ID2 comparisons

Using the supplied ID2 records, explain the baseline and variants in the two-candidate and four-candidate examples. Compare their record coverage and the differences documented in Module 03. Separate recorded observations from possible interpretations and identify the limits of the comparison.

Prompt 7: Understand ID3 and the session rule

From the ID3 documentation and session-completeness rule, explain what is checked, which records are used and where human review enters the workflow. Describe what the results establish and what remains outside their scope. Keep this as an explanation of the supplied documentation.

Prompt 8: Prepare useful review feedback

Review **[file, section or passage]** for clarity, consistency and source traceability. Identify the wording or example that needs attention, explain its effect on understanding, and propose a specific clarification. Include the component, version and source reference.

5. Record and share your findings

A useful research or review note records:

- **What you reviewed:** collection tag, component, file and version.
- **Your question or observation:** the passage, example or behaviour being considered.
- **Supporting context:** relevant sources, assumptions or reproduction details.
- **Your proposed contribution:** a clarification, correction, additional example or research question.

For citations, identify the original paper's author, document ID and version, together with the collection edition used: **v1.0-consolidated**.

Review AI-generated summaries against the source documents. Keep learning drafts, proposed interpretations and observed results distinguishable in your notes.

Feedback can be submitted through the repository's Issues page.
